7. STUDENT REFLECTION

1. What is the difference between an HTML tag and an HTML element?

Answer: An HTML tag is the code inside angle brackets, while an HTML element consists of the opening tag, the content, and the closing tag.

2. Why do we use semantic elements such as <header>, <main>, and <footer>?

Answer: We use semantic elements to make the website structure clearer, easier to understand, and more accessible for users and search engines.

3. What problem did you encounter while building or running your website, and how did you solve it?

Answer: I encountered a problem with the layout of my website. I solved it by checking my HTML and CSS code, finding the error, and correcting it.

4. If you had more time, what would you improve about your website?

Answer: I would improve the website's design, make it responsive for mobile devices, and add more interactive features to make it more attractive and user-friendly.
